

What is claimed is:

1. An electrical cable connector, comprising:

a plurality of terminals, provided within an insulating body and having a holding portion at its one end, and a corresponding tooth-like snap piece
5 provided at one end of the terminals, a contact portion provided at the other end of each of a plurality of terminals, and a holding segment provided between the contact portion and the holding portion, two interference portions respectively provided at the side portion of the holding segment;

a transmission cable, having an insulating cover layer and two electrical
10 cable groups formed within the insulating cover layer, the electrical cable groups wrapped by a metal shielding, and a first ground cable consisting of a plurality of twisted pair wires, a second ground cable provided outside of the electrical cable groups, and the two electrical cable groups and the first and the second ground cables respectively connected to the holding portions of a
15 plurality of terminals. With a plurality of terminals for holding the electrical cable, grounding area of the electrical cable is increased to prevent electromagnetic interruption (EMI).

2. The electrical cable connector as claimed in claim 1, wherein the holding portion is a U-shaped groove.

20 3. The electrical cable connector as claimed in claim 1, wherein the second ground cable has a plurality of twisted pair wires.

4. The electrical cable connector as claimed in claim 1, wherein a metallic woven screen is provided between the insulating cover layer and the metal shielding of the transmission cable.
